Product Name: Hygromycin B
Product Number: H007
CAS Number: 31282-04-9
Molecular Formula: C_{20}H_{37}N_{3}O_{13}
Molecular Weight: 527.52
Form: Powder
Appearance: Off-White or Light Tan Powder
Solubility: Water: Freely Soluble
Source: Streptomyces hygroscopicus.
Water Content (Karl Fischer): ≤15.0%
Potency (on a dry basis): ≥900 u/mg
Melting Point: 160-180°C
Storage Conditions: 2-8°C
Description: Hygromycin B is a unique aminoglycoside antibiotic derived from Streptomyces hygroscopicus. Hygromycin B is routinely used as a selection agent in transfection experiments.

This product is considered a dangerous good. Quantities above 1 g may be subject to additional shipping fees. Please contact us for questions.

Mechanism of Action: Hygromycin B, along with aminoglycosides, inhibits protein synthesis by strengthening the interaction of tRNA binding in the ribosomal A-site. Hygromycin B also prevents mRNA and tRNA translocation by an unknown mechanism.

Mechanism of resistance:

Hygromycin B resistance is conferred by the hph gene isolated from Streptomyces hygroscopicus, a 1467 bp fragment which encodes hygromycin B phosphotransferase (HPh). Cell lines successfully transfected with the hph gene produce hygromycin B phosphotransferase and convert hygromycin B to 7”-O-phosphoryl-hygromycin B by phosphorylating the 4-hydroxyl group on the cyclitol ring of hygromycin B. 7”-O-phosphoryl-hygromycin B lacks antibiotic activity and does not interact with prokaryotic or eukaryotic ribosomes.
Spectrum: Hygromycin B is effective against eukaryotic (mammalian) and prokaryotic (bacteria, fungi/yeast) cells.

Microbiology Applications: Hygromycin B can be used as a selection agent to isolate Hygromycin B resistant bacteria and fungi. The following Hygromycin B selection concentrations should serve as a guide only and may vary depending on experimental conditions and cells used:

- Bacteria (*E. coli*) - 50 µg/mL - 100 µg/mL
- Fungi - 100 µg/mL - 300 µg/mL
- Yeasts - 50 µg/mL - 200 µg/mL

Plant Biology Applications: Hygromycin B is routinely used as a selection agent for *Arabidopsis* plants that have been transformed with a hygromycin B resistance gene. A rapid method to screen for hygromycin B resistant *Arabidopsis* in less than four days has been developed. After *Arabidopsis* seeds have been transformed with a resistance plasmid (pBIG-HYG), they are plated on MS medium with hygromycin B and subjected to a two day stratification at 4°C in the dark. Seeds are then exposed to light for 4-6 hours to stimulate germination and then placed in the dark for another two days. Transformed seeds are selected and identified after a 24 hour period in the light. Resistant transformants are characterized by long hypocotyls. (Harrison et al, 2006).
